Database Management System for Pharmacy

Prescription and Medicine Stock Management System

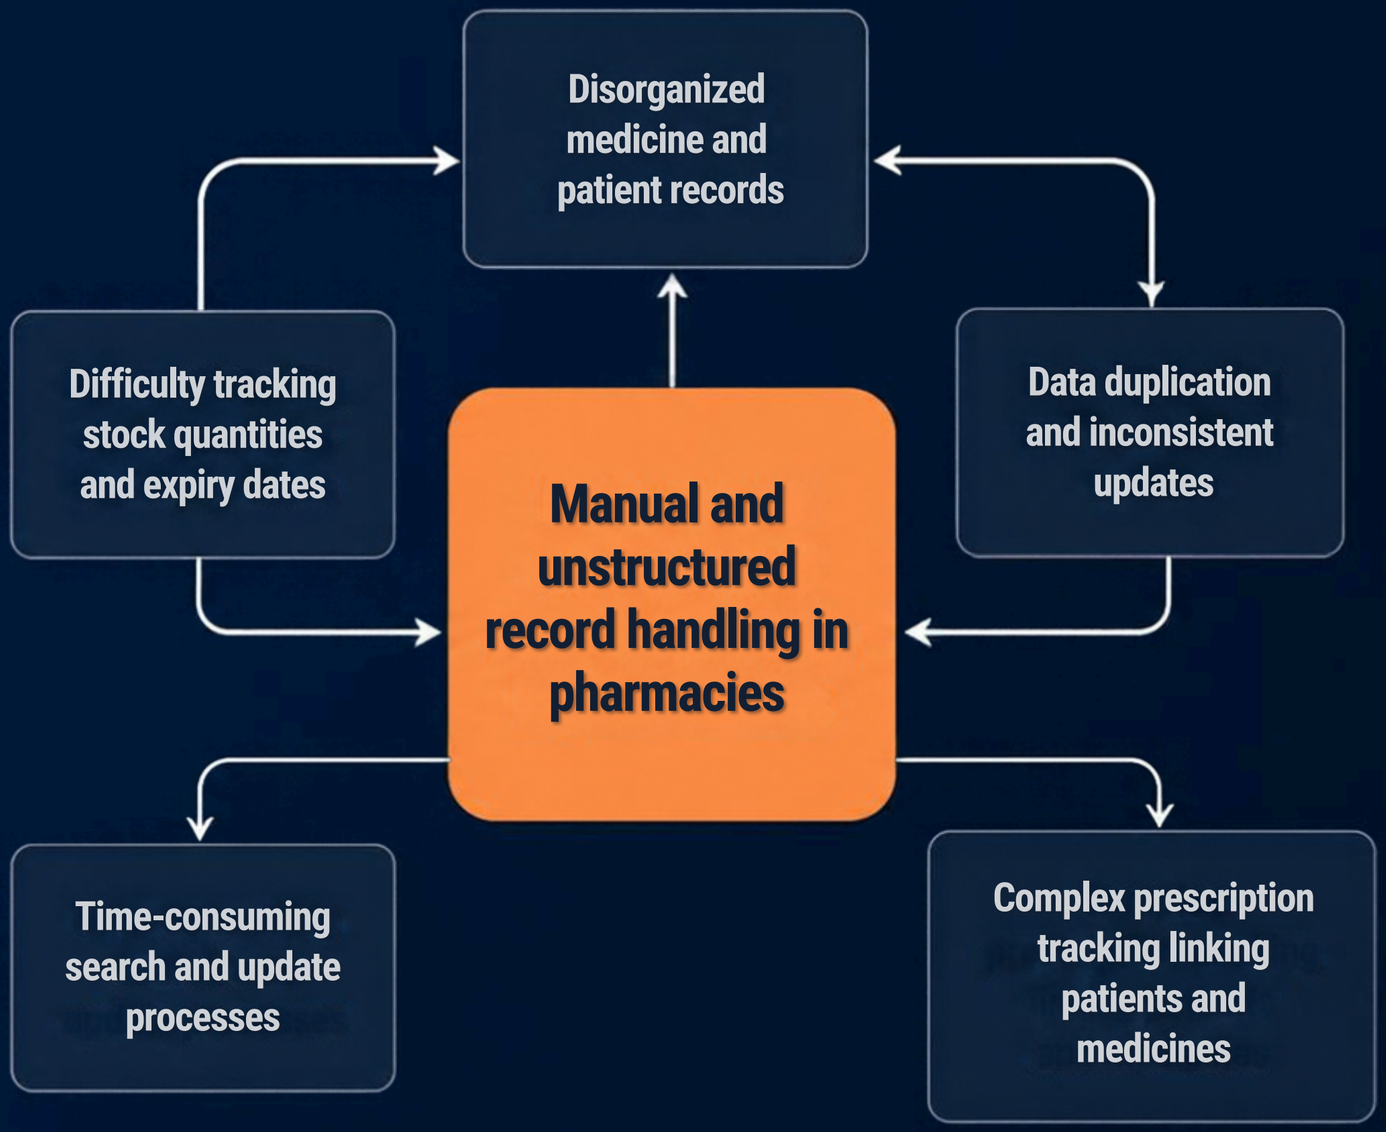

Presented by

Problem Description and Existing Approach Difficulties

Manual and unstructured records create bottlenecks across pharmacy operations, leading to errors, delays, and inefficiencies.

Proposed Solution Using MySQL and Database Structure

Objectives and Scope

- Create a structured MySQL database for pharmacy management
- Store medicine, patient, and prescription information systematically
- Establish relationships between patients, medicines, and prescriptions
- Simplify storage, retrieval, and management of pharmacy records
- Reduce difficulties from unorganized records

Thank You for Your Attention

The proposed MySQL-based database provides a structured foundation for managing pharmacy medicines, patients, prescriptions, and stock efficiently.

Unstructured / Manual Records → **Structured MySQL Database** → Organized Tables → Related Records → Easier Data Management
